## Enhanced Entity-Relationship (EER) Model

- The basic modelling concepts are only sufficient for some database applications.
- To reflect data properties and constraints more precisely, a number of enhanced ER models (EERs) were proposed.
- Each EER model includes all the basic modeling concepts of the ER model we discussed before.
- We will further discuss the following concepts in EERs:
  - **Subclass/superclass**
  - **Specialisation/generalisation**
  - **Constraints on specialisation/generalisation**

## 程序代写代做 CS编程辅导 Subclass and Superclass

- **Subclass of an entity** is a subgrouping of entities.
  - In many cases subclasses need to be **represented explicitly** because of their application significance.
- Superclass/subclass is a supertype/subtype and Class/subclass are different names for the same concept.
  - Subclass inherits attributes and relationships of superclass.
  - Subclass can have additional attributes and relationships.
- This type of relationship between subclass and superclass is often described as an **ISA relationship type**.

## 程序代写代做 CS编程辅导 Specialisation and Generalisation

- **Specialization** is the defining a set of subclasses of an entity type (top-down).
  - Defined on distinct features of entities in the superclass, e.g., based on the *job type* of each employee:

## 程序代写代做 CS编程辅导 Specialisation and Generalisation

- **Generalization** is a process of specialization (bottom-up).
  - Common features in subclasses may be generalized into single superclass (e.g. primary key).

## Constraints on Specialisation and Generalisation

### Disjointness constraints

- Specifies that the instances of the specialization must be **disjoint**.
- If not constrained, then entities in the subclasses may **overlap**.

程序代写代做 CS编程辅导

## Constraints on Specialisation and Generalisation

- **Completeness constraints**

- **total** – every entity in the superclass must be a member of at least one subclass.
- **partial** – an entity may not belong to any of the subclasses.

## Design Choices for the EER Model

- Specializations and (generalization) can be defined to make the conceptual model accurate.
- If the subclasses has no specific attributes and no specific relationships, then

WeChat: cs\_tutors

Assignment Project Exam Help

- can be merged into the superclass.
- replace with one or more type attributes specifying the subclass that each entity belongs to.

Email: [tutorcs@163.com](mailto:tutorcs@163.com)

QQ: 749389476

<https://tutorcs.com>

- Choices of disjoint/overlapping and total/partial constraints are driven by rules in the miniworld being modeled.

## Informal Method for Constructing an ER or EER Model

- Draw an ER or EER diagram to represent the following design:

- (1) Identify the entity types (including weak entity types)
- (2) Identify the relationship types (including ISA and identifying relationship types)
- (3) Identify the attributes of entity and relationship types (and their underlying domains)
- (4) Identify a primary key for each entity type
- (5) Classify each binary relationship type identified in step 2 (i.e. one-to-one, many-to-one or many-to-many)
- (6) Determine the participation constraints for each entity type in each binary relationship type
- (7) Determine the disjointness and completeness constraints for each ISA
